

Professional Series Rack Frame ~~ SIDE PANEL ~~ Installation Instructions

The sidepanel option is available for 20", 25" or 30" depth racks of any height from 4U to 45U (see figure 1).

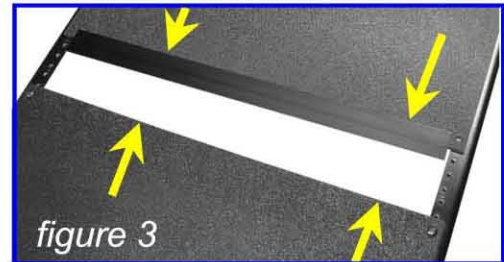

Sidepanels are precision cut with specially routed corners to fit the sides of your rack (see figure 2).

For 25" depth racks of 43U to 45U height and 30" depth racks of 37U to 45U, please skip to step #2 below.

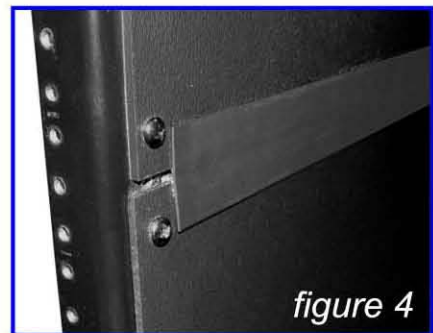

STEP #1

Installation is easiest if rack is carefully laid on its side. Use the supplied 10-32 rack screws to fasten your sidepanel. **DO NOT TIGHTEN SCREWS** until all screws have been installed and side panel is aligned properly. Once all screws are in place and tightened, perform the same procedure on the opposite side.

STEP #2

Your sidepanels are supplied as a 2-part assembly for each side to minimize freight costs. Each 2-part side panel has an identical upper and lower section that attach to the other with a double channel plastic extrusion (see figure 3). Installation is easiest if rack is carefully laid on its side. Attach both halves of your side panel with supplied double channel plastic extrusion. Note that the plastic extrusion is narrower than the sidepanel. When attached, it should be inset by approximately 1/2" on both sides (see figure 4). Use the supplied 10-32 rack screws to fasten your assembled sidepanel. **DO NOT TIGHTEN SCREWS** until all screws have been installed and side panel is aligned properly. Once all screws are in place and tightened, perform the same procedure on the opposite side.
